

COMPARE YOUR BONES

Oh Mx. Muscles, isn't that obvious for me?
But I do wonder how your bones look like...

Have you ever wondered how your bones look like?

Your skeleton is unique. This demo uses statistical shape modelling to predict what it looks like in 3D.

A few measurements from your body are used to estimate the shape of your bones. The SSM compares these measurements to patterns learned from many image-based models. Your 3D model is then generated in seconds.

How does this demo work?

1. Using a tape measure, get estimates of your:

clavicle length
humerus length
epicondyle width

2. Enter your data and hit run!
3. Inspect your bones and compare to the average bone model.
