

FIND YOUR BONES

These are 2D slices of the body. If we trace out the structures on each image, we can reconstruct the bones in 3D!

I have no idea what I am looking at. Do you know what is muscles and what is bones?

Can you find the bone? Try out image segmentation and help turn a CT scan into a 3D model.

You will use a digital paintbrush to outline a bone on a CT scan. Each marked region becomes part of a **segmentation**, a labelled representation of the bone. This is the first steps in creating a 3D model from medical imaging data

How does this demo work?

1. Scroll through the CT scan and identify the bone.
2. Paint the bone on each slice.
3. Click 'Reveal 3D' to look at the reconstructed 3D model of the bone.
