

SEE YOUR MUSCLES

I am looking at your **biceps brachii muscle**, the muscle that can flex your elbow. And I can even see its fascicles!

Hey, Mx. Bone!
What can you see with your ultrasound system?

Ever wondered what your muscles look like? Take a peek beneath the skin with ultrasound imaging.

An ultrasound transducer is placed on the skin over a muscle. It captures live images of the tissues beneath the skin. You can watch your own muscles change shape as you move, flex, and relax.

How does this demo work?

1. Put some ultrasound gel on the ultrasound transducer.
2. Un-freeze the ultrasound system to see the live images on the screen.
3. Place the transducer lightly on your skin. Rotate the transducer on the skin until you can see the muscle fascicles as straight lines: this is the **longitudinal** orientation.
